 2) Hoisting line speed varies with load.
 3) Line pull is based on a single line pull in high speed range.
 4) Effective line pull is equivalent to available line pull of mechanical drive winch.

- 5) When starting, hydraulic motor is without rotating, the line pull is "Max. starting line pull" After motor rotating, the line pull becomes "Max. running line pull" shortly.

Crane Ratings

BS Rating:

The rated loads are determined according to BS (British Standard, 1981) and the machine is stationed on firm level ground.

PCSA Rating:

The rated loads, listed are determined according to PCSA (Power Crane and Shovel Association in U.S.A.) and do not exceed 75% of tipping load on condition that the machine is stationed on firm, level ground.

JIS Rating:

The rated loads shown don't exceed 78% of tipping loads with the machine on firm level ground.

Rated Load for Main Boom

- Notes: 1) The rated loads shown are based on the machine on firm level ground without traveling.
 2) The rated loads shown include the weights of all lifting attachments, such as hook and bucket. The load to be actually lifted is the rated load minus the weight of all lifting attachments.
 3) When the jib or the auxiliary jib is attached, the load to be actually lifted is the rated load minus the weight listed below.

Jib length	6.10 m (20'0")	9.15 m (30'0")	12.20 m (40'0")	15.25 m (50'0")	Aux. jib
Weight to be reduced	700 kg (1 540 lb)	850 kg (1 870 lb)	1 000 kg (2 200 lb)	1 150 kg (2 540 lb)	200 kg (440 lb)

- 4) The jib can be attached to boom of 22.0 m (72'2") to 43.0 m (141'0") long.
 5) The auxiliary jib can be attached to boom of 13.0 m (42'8") to 49.0 m (160'8") long.
 6) The rated load for auxiliary jib is equal to that of main boom at the same working radius, but do not exceed maximum rated load 5 000 kg (11 100 lb).
 7) Counterweight is 15 900 kg (35 100 lb).
 8) In operation, crawlers must be extended.

1. The rated total loads given in the table above are values taken at the time when the load is to be lifted with the machine placed on a flat, firm ground, not exceeding 78% of tipping loads and with the forward stability of 1.15 or more as specified in the Travelling Crane Construction Standards.
 2. The load to be actually lifted will be the value of each rated total load given in the table above minus total weight of all lifting means such as hook.
 3. Hook weight: 15-tonne capacity hook (for tower crane) 0.4 tonne.

Main and Auxiliary Hoist Mechanism

Both main and auxiliary hoist drums are driven independently by swash plate type axial piston motors through reduction gear. Load hoisting/lowering are done by normal/reverse rotation of motor. Smooth, precise power lowering is made possible by the hydraulic brake. A single lever gives a choice of two speeds, high or low, for hoisting/lowering. Hoist/lower speeds are proportioned to the lever stroke, allowing easy matching to job conditions.

Option: One motor driven type winch for main and auxiliary drums is available.

Clutches Clutches are of the spring-set, hydraulic-released internal-expanding friction band type; main and auxiliary clutches are alike in size and type, with interchangeable clutch linings.

Brakes External contracting friction band-type mechanical brakes, integrated with link lever, operate under normal load. For a larger load, a spring-type boost device is provided to ensure fatigue-free operation. Mechanical brake locks are equipped as standard. Furthermore, while in neutral position the hoist lever is doubly secured in position by a hydraulic brake and an automatic brake. An automatic brake system or hydraulic positive brake system, in neutral position of the hoist lever, can be selected according to job application.

Drums Main and auxiliary hoist drums are of special alloy cast iron. Both hoist drums are mounted on the lifetime-lubricated antifriction ball bearings.

Drum locks Drum pawl locks are provided for integral lock of drums. They are manually controllable from the operator's seat.

Boom Hoist Mechanism

Completely independent operation.

Boom hoisting/lowering is done by normal/reverse rotation of the bent axis motor. Boom lowering is made by power lowering through the hydraulic system. Instant hoisting/lowering of boom is possible. Both hydraulic brake and spring-set hydraulic-released multiplate disc type brake offer positive and safe stopping of boom. When boom is hoisted or lowered, brakes are automatically released.

Boom Brakes Spring-set, hydraulic-released multiplate disc type. Brake is automatically actuated when control lever is at neutral position.

Drum Locks Drum pawl lock is manually controlled from operator's seat.

Swing Mechanism

Completely independent operation. Driven by high-torque piston motor through reduction gear, swing speeds are freely controllable within the 0 to maximum speed with single lever stroking.

Swing Brake A disc type swing brake can be hydraulically actuated by the brake switch on the swing lever.

Swing Lock Manually operated mechanical lock with a roc tip which is engaged in a holder of track frame during transportation.

Swing Circle Single-row shear-type ball bearing with heat-treated internal gear.

UNDERCARRIAGE

Traction mechanism Each track is driven by a bent axis motor through reduction gear. This mechanism allows counter-rotation of tracks for maximum maneuverability in close quarters.
